

## DuroBearings: The perfect all-rounders in corrosive environments

Our DuroBearings are used in special industrial applications, such as ship cranes or construction equipment. The composition of the material contributes to the fact that this product is ideally suited for use in corrosive environments, such as seawater, and in acidic environments. The filament-wound sliding bearing stands out for its

freedom from maintenance, corrosion resistance, and low coefficient of friction. Due to the special fibre matrix structure in combination with the Teflonliner, both edge pressure and impacts are absorbed very well. Lohmann offers its customers, not least because of its tube processing on site, an extremely flexible delivery performance.

As a rule, dimensions in accordance with DIN ISO 3547 and also with DIN ISO 4379 are available. We can manufacture cylindrical sliding bearings as well as thrust washers made from epoxy resin sheets with reinforcements in glass fibre.
